

# SED Flow Control GmbH

## New diaphragm design

We have optimized our product portfolio of diaphragms. The PTFE diaphragm Code 51 will have a „cross“ weir contour. This completes the redesign of the MA8 diaphragm series. The new version will be sold from 1<sup>st</sup> September 2019. The article match code will not change. The remaining stocks will be sold out. There will be no mixture of the two designs within one order.

Please notice the main benefits and differences of the new diaphragm. If you have any further questions, please do not hesitate to contact your sales representative as usual.

Previous Version

New Version

### Benefits

- Optimized assembly: The use of membranes with „cross“ weir avoid incorrect alignment of the diaphragm
- The tightness of the valves is always guaranteed. No matter whether the actuator is mounted in or 90° to the flow direction
- The new diaphragm will be available with an integrated RFID chip soon. This makes it even easier to track batches
